Notes

Liquidity =

- Doji
- Double Tops / Bottoms
- Trendline
- Big Wicks

1. go on htf to find a move
2. check the beginning of the move
3. refine it to where the manipulation happened
4. refined down to ltf u see multiple manipulation probably
5. that's ur true stop

Small Trading Plan.

1-Bias

2-Manipulation Zone

3-Major Liquidity taken and Major liquidity Target

4-Waiting for manipulation sign :Fu negation or hcs or fu retest.

Doji

Strong FU / Attempted FU / Low Lqd move

Failed FU / negating FU

HCS

Order Block

FU as it forms

Last Area of Liquidity

Manipulation Cycle / Zones

Calc. Lqd

True Stop

Strength of Patterns

Imbalance

Order Blocks have hardly any wicks

they are "odd" candles

they are identified on weekly to 1h

Only the bodies are marked as POI zones

Notes

- Manipulation: Body inside a Wick (Outside / Inside Bar)
- ... followed by a Doji can be taken as direct entry
- weekly to 1h for Order Blocks
- Order Blocks need to have HCS inside
- 30m and lower are for entries only

Marked out Zones:

OB + FU and other manipulations

- 1) find an OB (prev. move has started from there)
- 2) OB followed by an FU
- 3) find other manipulations to confirm stronger areas

Signs of Manipulation

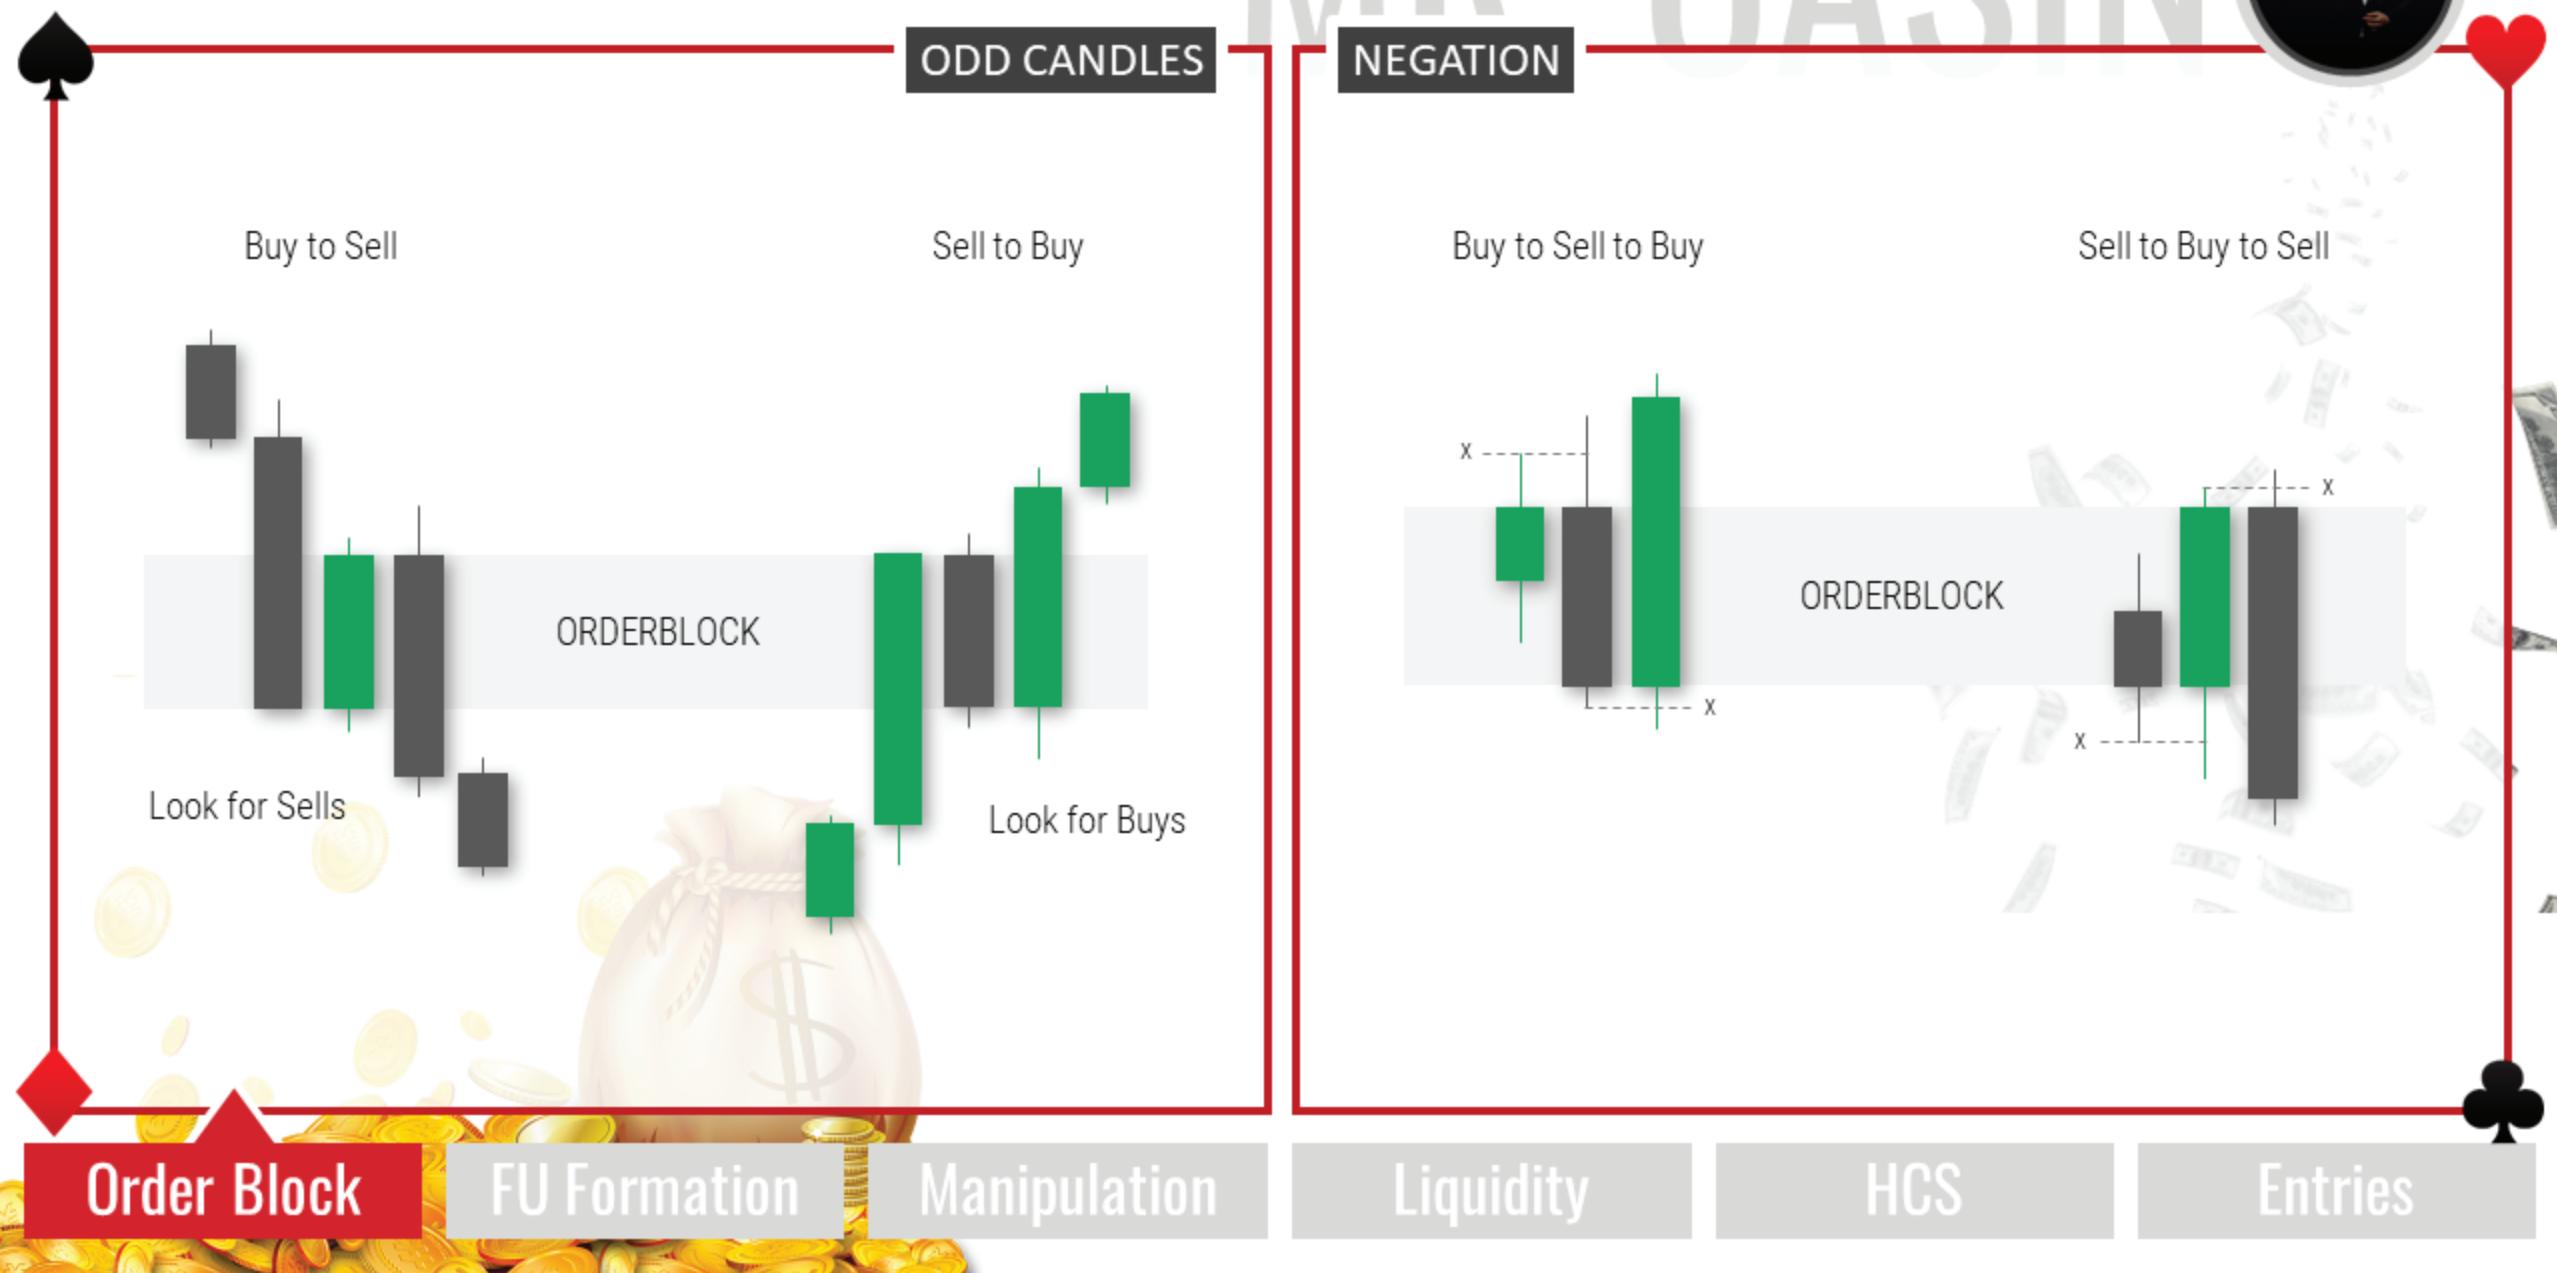

- OB (for the overall zone)
- FU
- AFU
- LQ grabs
- FU retest with FU (Strongest manipulation HCS)
- FU retest (Stronger manipulation than ordinary FU)

Check OBs for HCS inside the Wicks
After a BIW you can expect a reversal / negation.

Calculating LQ is done by counting the HCS on HTF

FU TYPES + STRENGTH

MR CASINO

Candlestick

Bearish

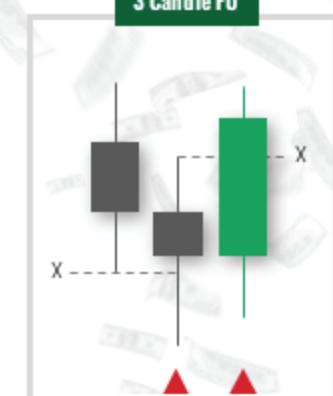

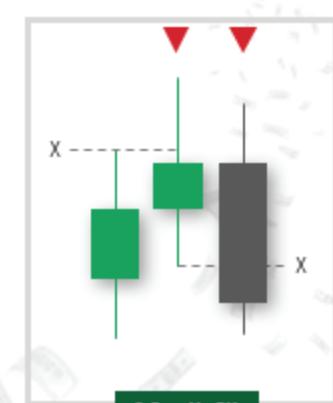

Bullish

They are considered as **Low Liquidity Moves**

SFU = Strong FU
AFU = Attempted FU
BIW = Body inside Wick

An FU is that candle which takes liquidity (of any certain kind, in any area) and then reverses in the opposite direction all in the same candle. The part of the candle which took the liquidity (will be denoted by a wick) is called the FU.

Order Block

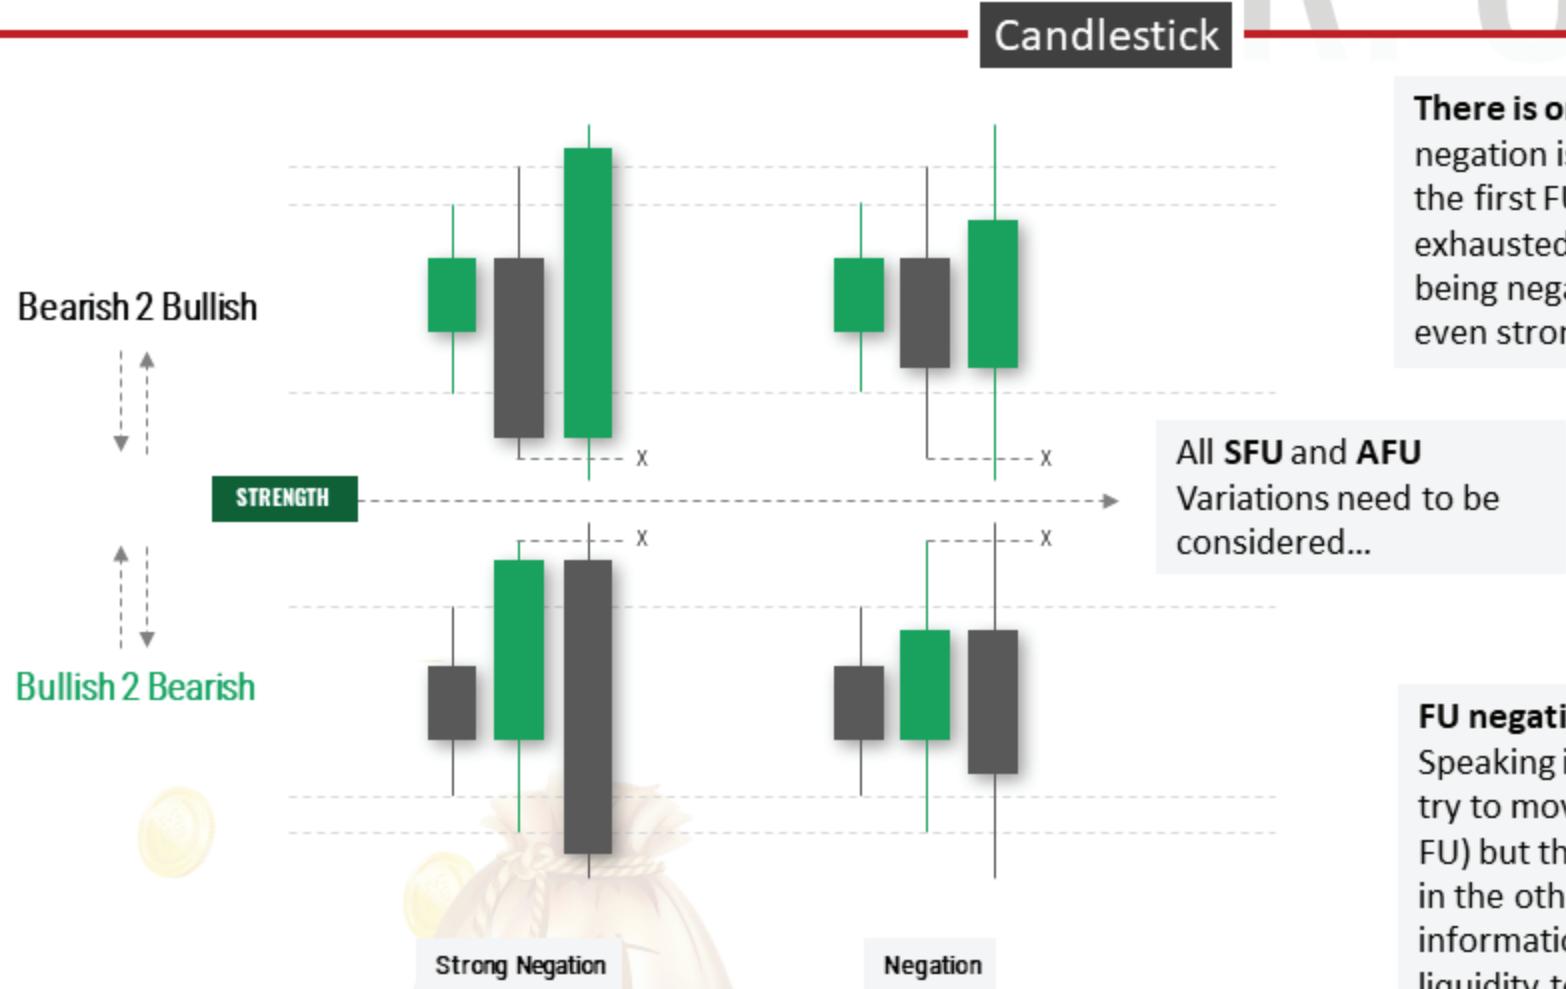

FU Formation

Manipulation

Liquidity

HCS

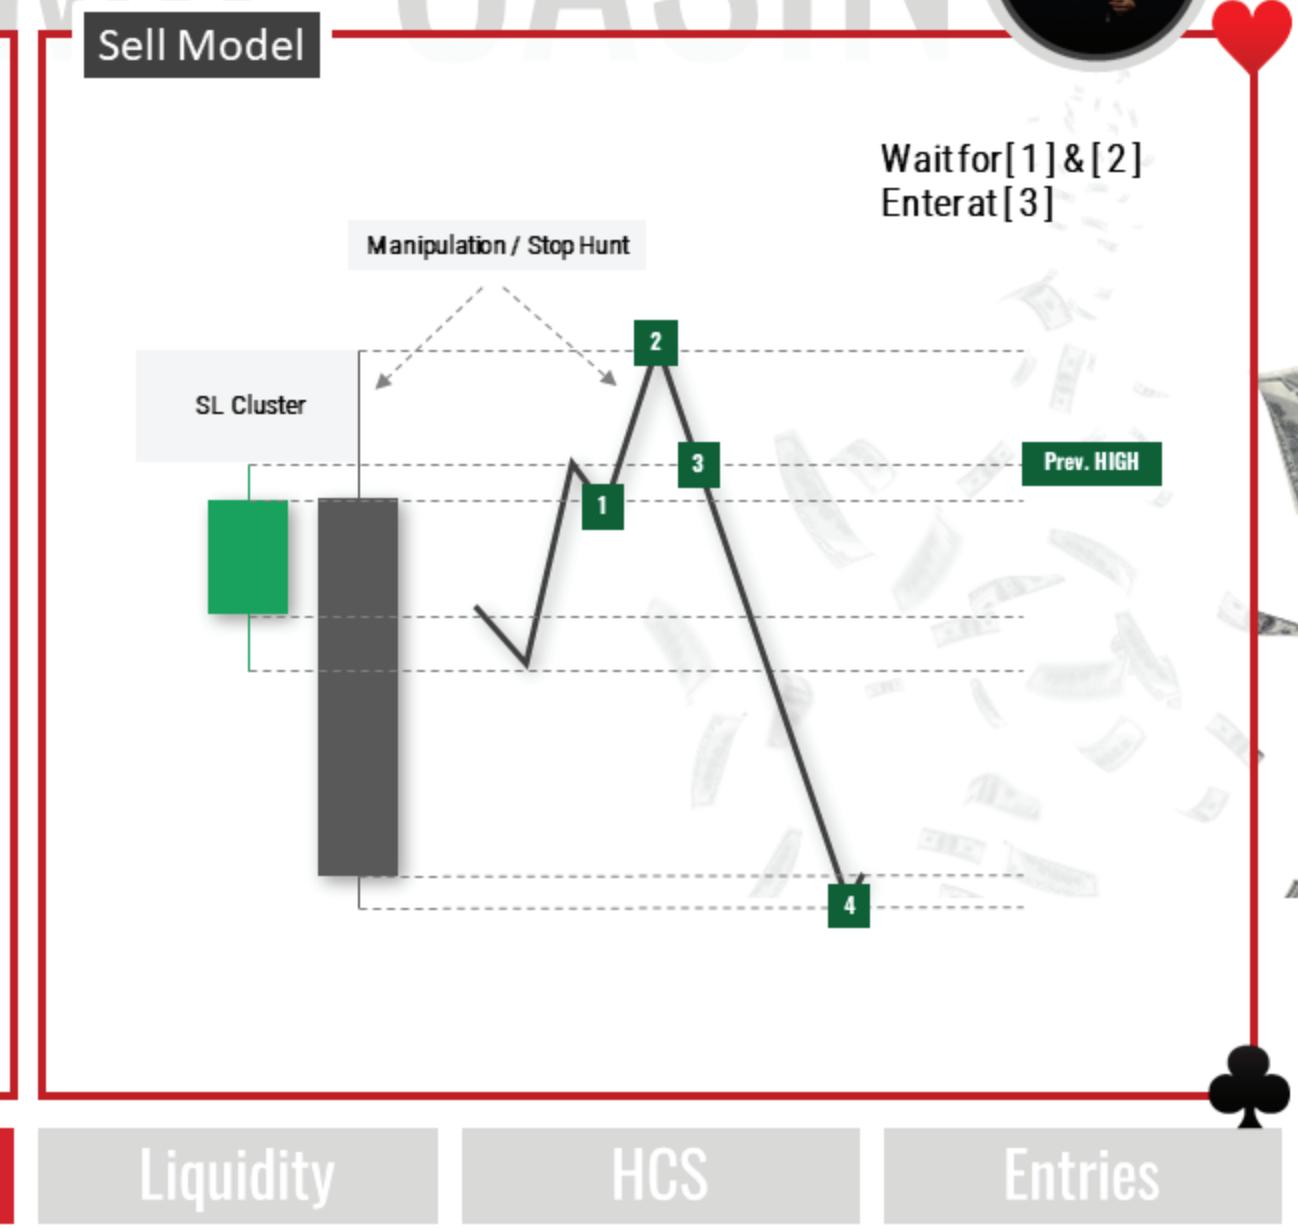

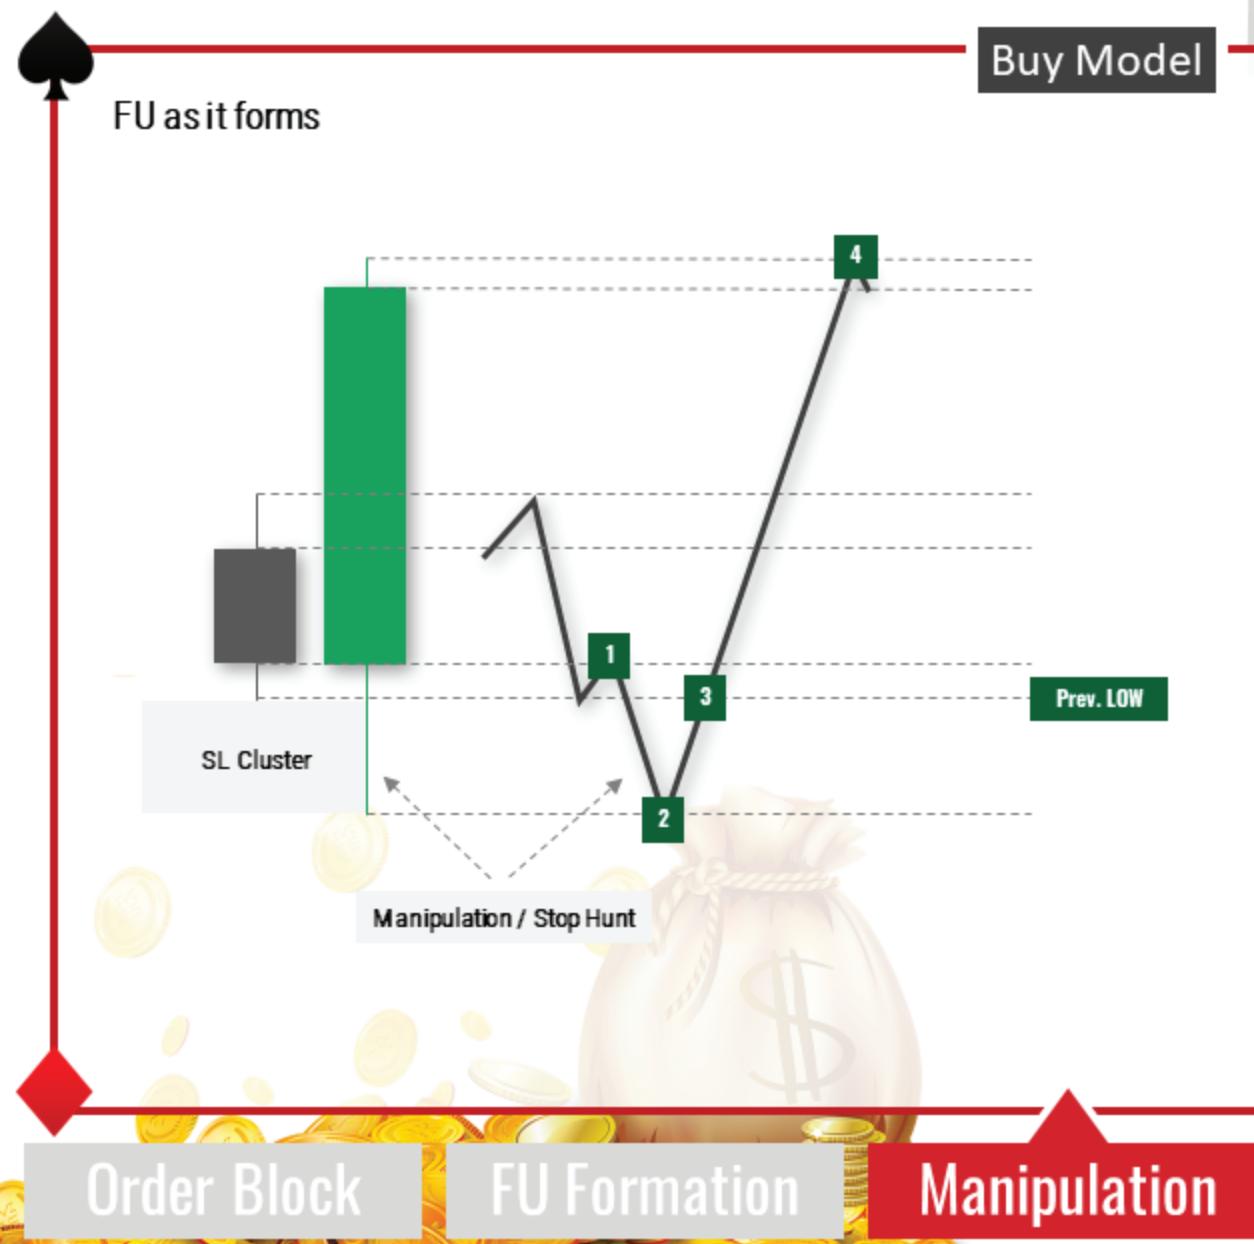

Entries

FU negations are the easiest way to spot the reversal. Speaking in terms of manipulation that is when banks try to move price in a certain direction (producing an FU) but the candle right after "negates" to form an FU in the other direction. Seeing it - we take the information for a potential change in orderflow (e.g. if liquidity to the downside was targeted now, we are targeting the liquidity to the upside).

MANIPULATION CYCLE

MR CASINO

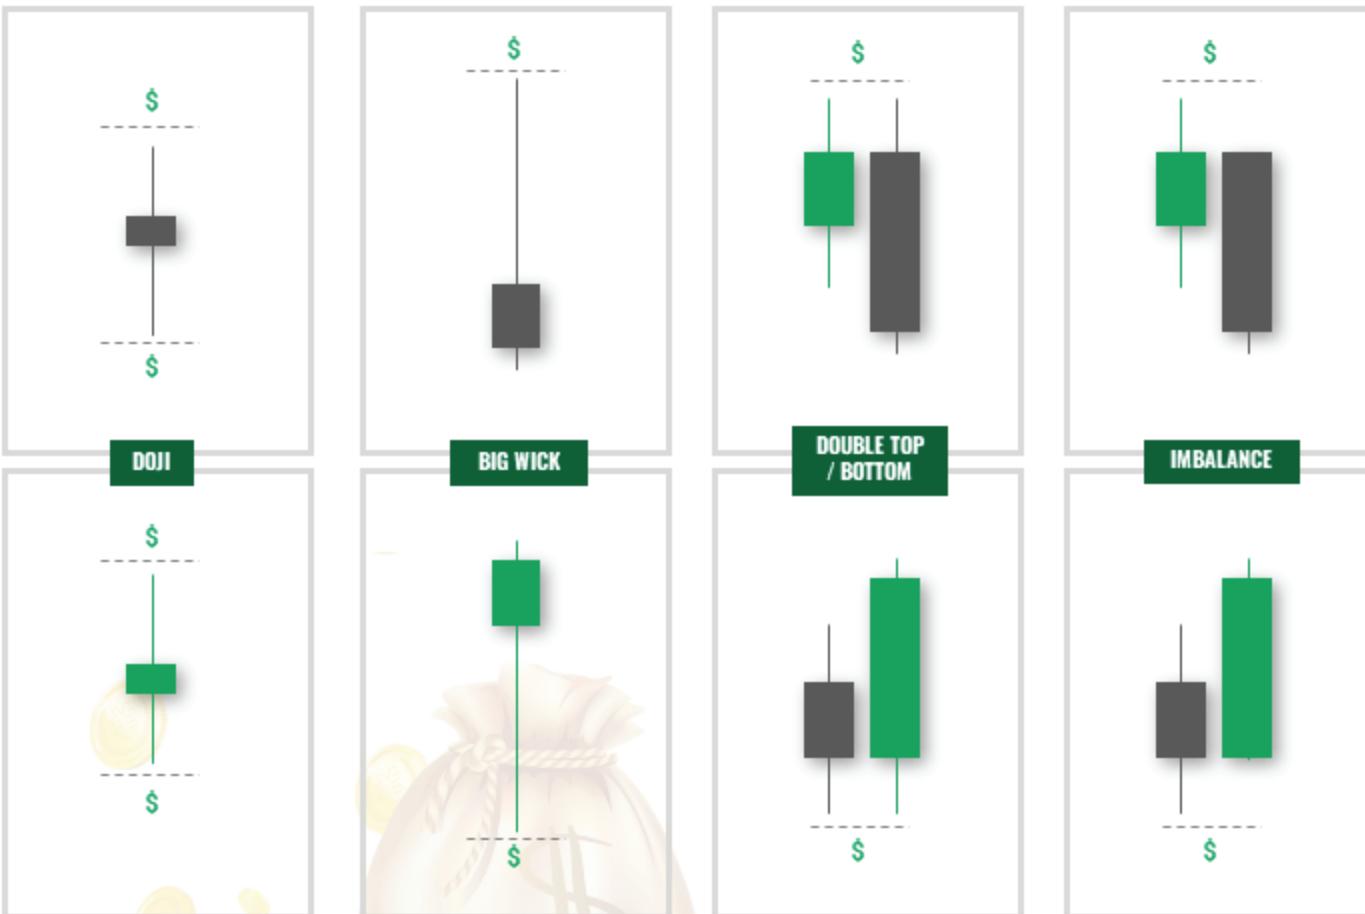

MAIN RETAIL FOCUS

MR CASINO

Candlestick

We do not see these as a confirmation to take a trade and they are ultimately just generating liquidity before the true move.

Remember...

We do not trade on the side of retailers... We see these as signs of **liquidity generation** and we can understand the true market direction.

OTHERS

Trendline
and other commonly
taught retail
patterns ...

Comprehensive Summary

Part I

Needed to understand the general flow and to calculate liquidity

higher timeframes will overpower lower timeframes

strength of manipulation (weak to strong): AFU – FU – FU retest – HCS – HCS x

Liquidity itself

Liquidity has the highest priority

an FU is always a manipulation

Minor Liquidity

indicates that liquidity was left behind for the "next time" until we reach the next target

FU after minor liquidity indicates that prior liquidity is not relevant yet

Imbalances

we don't want to see any reversal starting from an imbalance

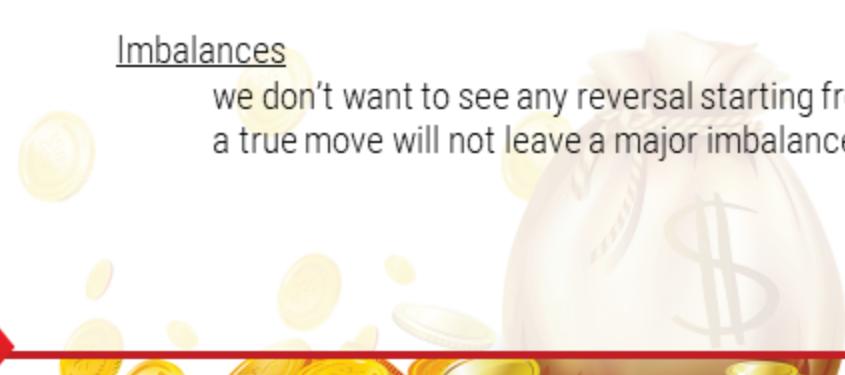

a true move will not leave a major imbalance

4 types of major liquidity:
(reason to target)

1. a doji (not a AFU)
2. perfect (!) double tops/highs
3. perfect (!) trendlines (3+ touches)
4. imbalanced candles (5m+)

4 types of low (minor) liquidity:
(no reason to target)

1. AFU (not a doji)
2. imperfect (!) double tops/highs
3. imperfect (!) trendlines
4. balanced candles (5m+)

Comprehensive Summary

Part II

Calculate Liquidity

- if major liquidity is overpowered with a HTF manipulation we have an indication that this liquidity will hold for a while
- if major liquidity forms and is followed by a SFU/HCS we also have an indication that this liquidity will hold for a while

Until our last area of liquidity to the other direction is met (and if the reaction is in line with the HTF strength).

- Last areas of liquidity are the most concentrated and refined areas of liquidity.
- We can expect a reaction/reversal after it is met and if we have a major target to the other direction.
- If we see a clear sign (SFU/HCS) at this point, aligned with the overall flow, we have an entry point or target.
- If price shows strong manipulation and leaves low liquidity, we can expect price to push to the next target.

4 types of major liquidity:
(reason to target)

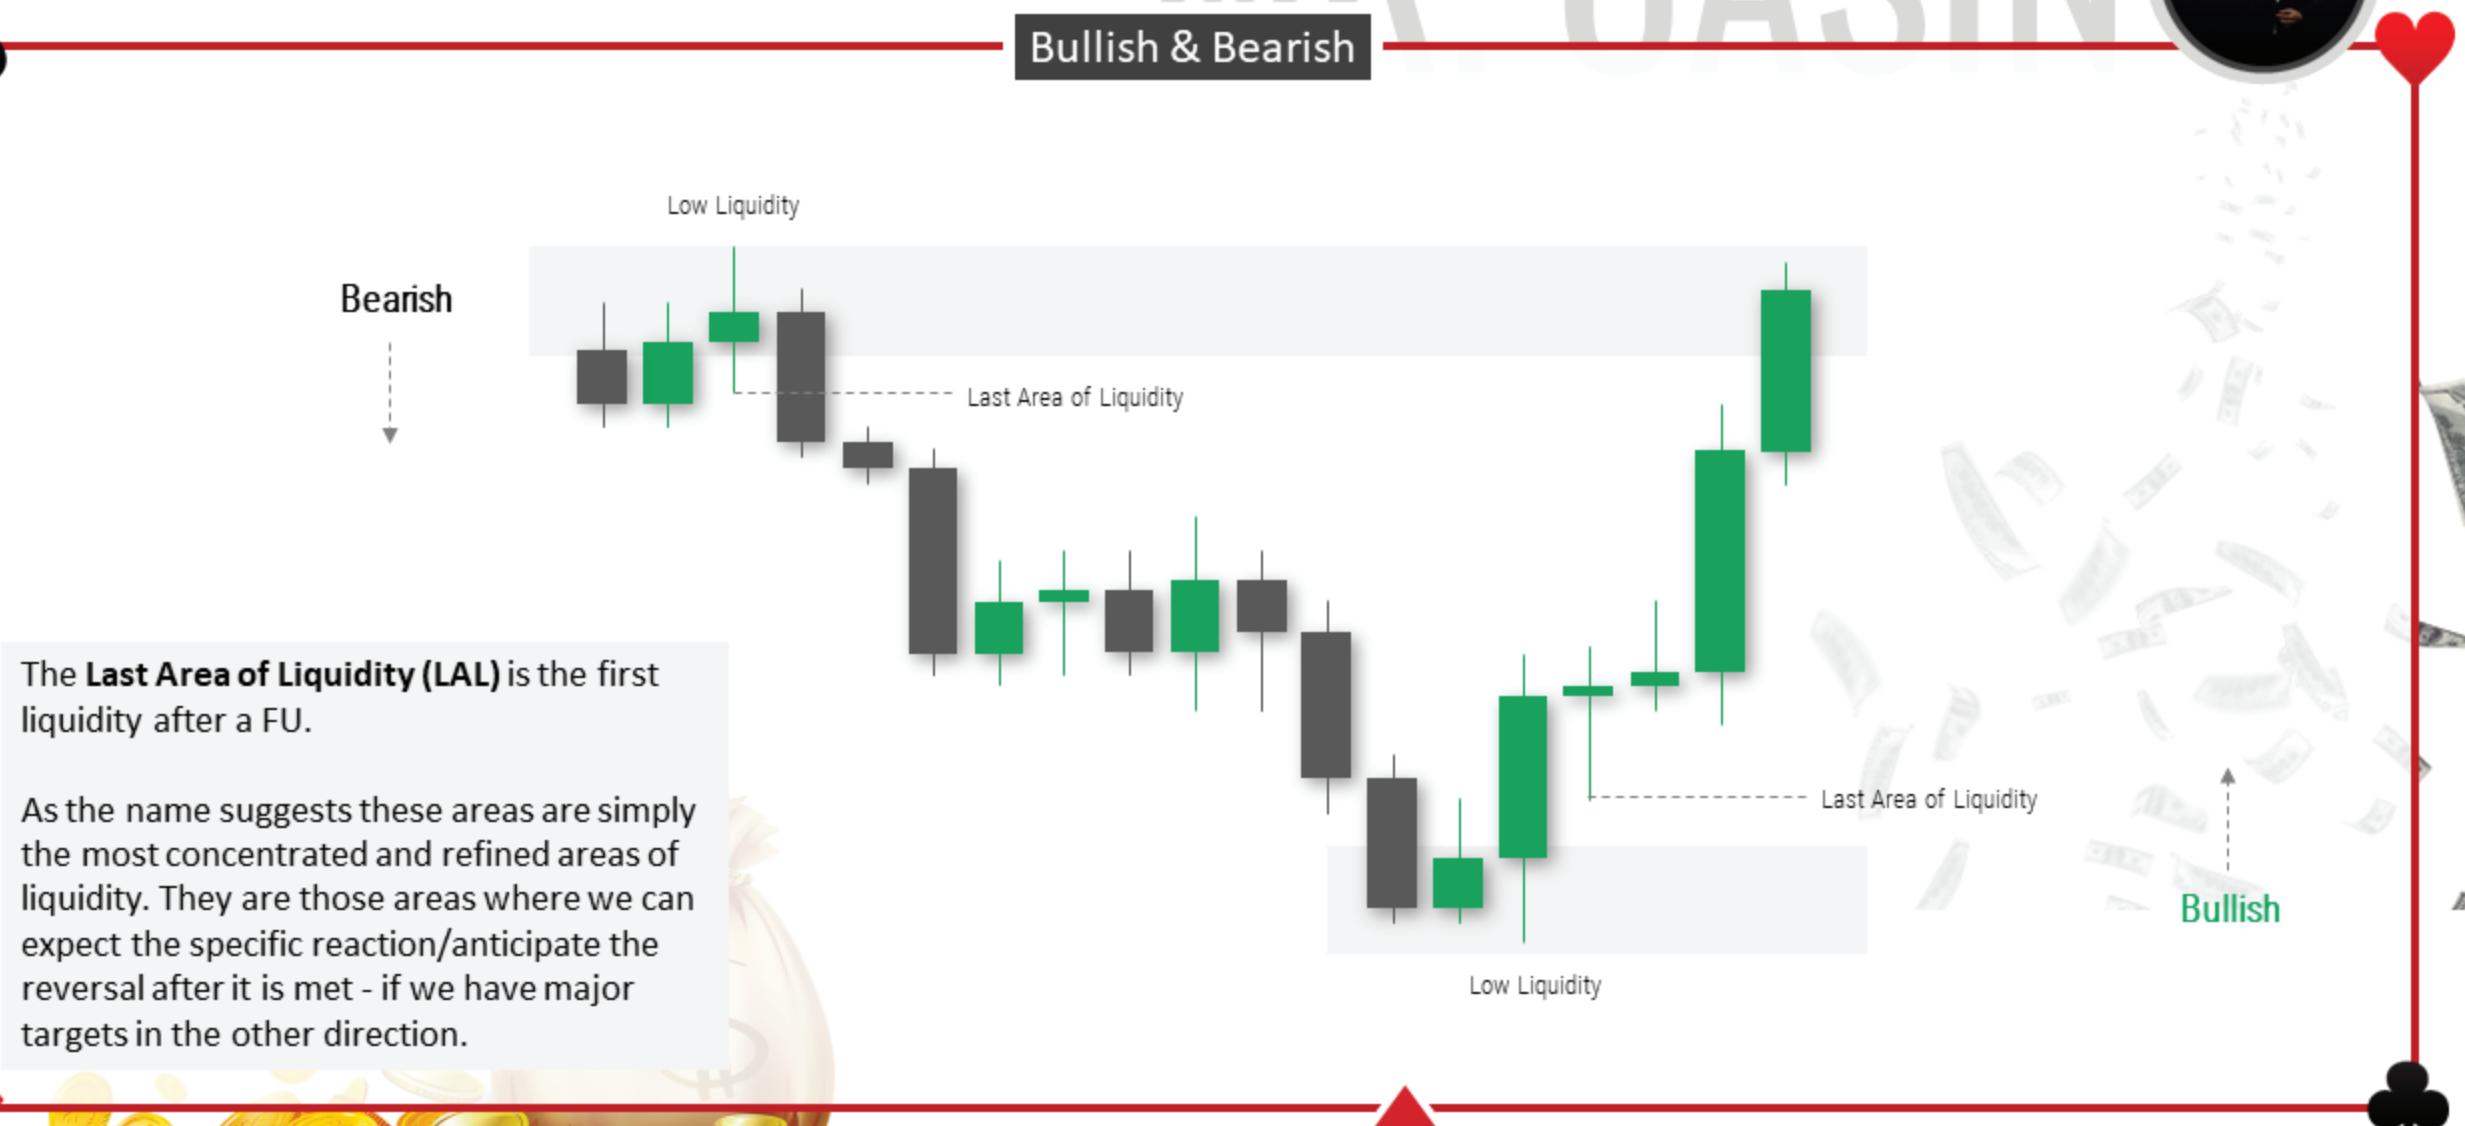

1. a doji (not a AFU)
2. perfect (!) double tops/highs
3. perfect (!) trendlines (3+ touches)
4. imbalanced candles (5m+)

4 types of low (minor) liquidity:
(no reason to target)

1. AFU (not a doji)
2. imperfect (!) double tops/highs
3. imperfect (!) trendlines
4. balanced candles (5m+)
